Problem 1:	1
Problem 2:	2

Problem 1:

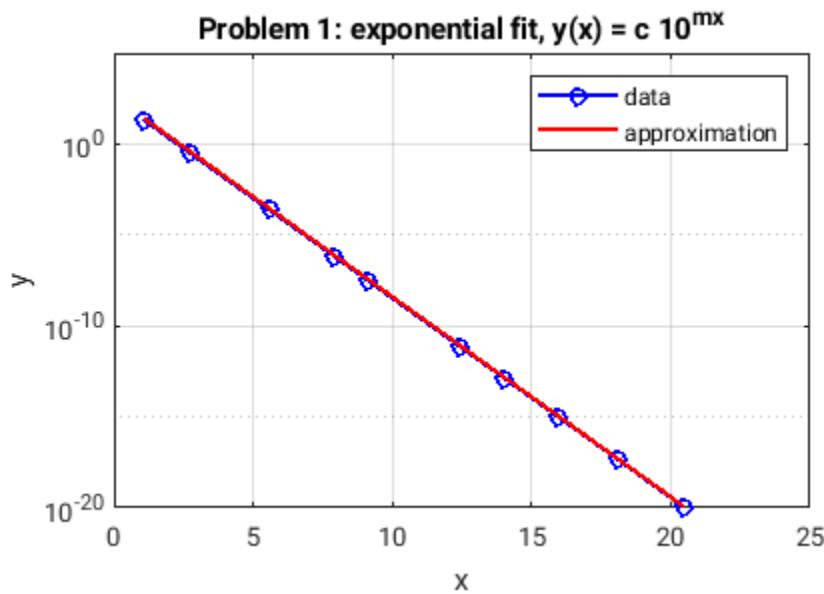

Fit function to x,y data in file data1.asc

```
d = load('data1.asc'); % load data from file data1.asc into matrix d
x = d(:,1); % assign 1st column of d to vector x
y = d(:,2); % assign 2nd column of d to vector y

fig = figure(1);
fig.Position = [0.1 0.1 450 300];
clf(); % clear figure
semilogy(x,y, 'bo-', 'linewidth', 1.5); % plot data as blue line
hold on; % hold figure
grid on % plot a coordinate grid

yapprox = 400*10.^(-1.1*x); % constants estimated from graph of data

plot(x, yapprox, 'r-', 'linewidth', 1.5) % red dotted line
xlabel('x')
ylabel('y')
legend('data', 'approximation')
title('Problem 1: exponential fit, y(x) = c 10^{mx}');
```

Problem 2:

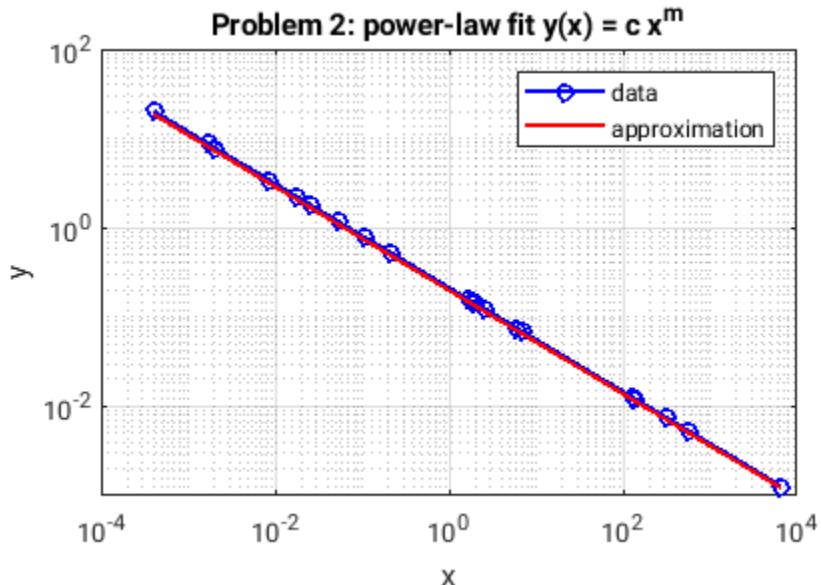

Fit function to x,y data in file data3.asc

```
d = load('data3.asc'); % load data from file data1.asc into matrix d
x = d(:,1); % assign 1st column of d to vector x
y = d(:,2); % assign 2nd column of d to vector y
clf(); % clear figure

loglog(x,y, 'bo-', 'linewidth', 1.5); % plot data as blue line
hold on; % hold figure
grid on % plot a coordinate grid

yapprox = 0.2*x.^(-0.58); % consts estimated from graph of data

plot(x, yapprox, 'r:', 'linewidth', 1.5) % red dotted line
xlabel('x')
ylabel('y')
legend('data', 'approximation')
title('Problem 2: power-law fit y(x) = c x^m');
```
